

Plastic Pollution : A Challenge for Our Future .

Plastic pollution is one of the major environmental challenges of our time . Plastic waste can enter rivers , oceans and soil . Animals may swallow plastic or become trapped in it . One effective way of managing this waste is segregation . Plastic should be separated from biodegradable waste and sent through appropriate collection and recycling systems .

Technology and recycling industries can help manage plastic , but people's participation is equally important . Citizens must understand that throwing waste into a common bin does not make the problem disappear .

We must move from a "use and throw" ~~cultural~~ culture to a "use responsibly" culture . If we

reduce unnecessary plastic and
segregate the plastic we do use,
we can protect our environment
for future generations.
