

Plastic Waste and its proper Segregation

Plastic is one of the most commonly used materials in our daily lives. We use plastic bags, bottles, wrappers, containers and many other things. However, Plastic waste is becoming a serious problem for our environment.

One important way to manage plastic waste is segregation. We should separate plastic waste from wet waste such as leftover food and vegetable peels. Clean and recyclable plastic should be placed in the dry-waste bin. This makes it easier to recycle and reuse plastic.

School and homes can teach children to use separate dustbins. We should also avoid unnecessary plastic bags and carry cloth bags instead. Plastic segregation is a small step, but it can make a big difference. By managing plastic responsibly, we

Keep our surrounding clean and protect nature.
