

# The 3Rs and Plastic Waste Management

The three Rs - Reduce, Reuse and Recycle - are important principal for managing plastic waste.

First, we should reduce the amount of plastic we use. We can carry cloth bags and reusable bottles.

Second, we should reuse plastic containers when they are safe and suitable for reuse. Third, recyclable plastic should be segregated and recycled through proper waste collection systems.

Segregation is essential because recyclable materials become difficult to recover when mixed with wet and dirty waste.

The 3Rs encourage us to think before buying, using and throwing away products. They help us conserve resources and reduce pollution.

If every citizens follows the 3Rs, our communities can move closer to sustainable development.
